AI at Work

AI training for Marketing

COLOMBINIGROUP
BETTER DESIGN. GREATER PROJECTS.

October 2026
Intro and setting

AI at Work

AI training for Marketing

Why we're here today

In marketing, time goes in two ways: creating content and handling repetitive operations.

AI can help on both fronts, without betraying the brand and without becoming yet another job to manage.

Goals for the day:

- understand which AI to use for what
- get to know Claude in depth and set it up well from day one
- learn a method to automate repetitive work on your own

What we'll cover today

01 The landscape: ChatGPT, Claude, Gemini, Perplexity, Leonardo AI

02 The prompt: how you talk to an AI

03 ChatGPT, Claude and Gemini compared

04 Inside Claude: surfaces, modes, workspace, models and tokens

05 Working well: projects, folder, artifacts and files

06 Skills and agents: skills, agents, connectors, scheduled tasks, Code

07 The ideal setup

08 Automating the repetitive

09 Trust and the first step

10 An events office with Claude

11 Leonardo AI in detail

AI empowers those who use it

The AI landscape

Section 01 · Five tools, five jobs

How fast the AI world moves

Seven months have passed since our first training in March. In the meantime:

- Claude has gone from Opus 4.6 to Opus 5.5 and Sonnet 5.5
- ChatGPT has moved to the GPT-6 family: Astra, Sol, Luna
- Gemini works with the 3.x models; Gemini 4 has been announced
- Claude Design was born (April), today inside Claude
- in the Claude app, chat and Cowork are no longer separate: one single conversation
- scheduled tasks run in the cloud, even with your PC switched off

Important: learn the method, not the buttons. Buttons change, the method stays.

How an AI thinks

A generative AI doesn't think and doesn't know: it completes text in the most likely way, based on everything it has read.

Practical consequences:

- where information is missing, it fills the gaps with generic or made-up answers
- the more context you give it, the more the result is yours and not everyone's
- it always needs rereading: a brilliant collaborator, not an oracle

Text AIs and image AIs work with the same logic: the prompt drives everything.

Five jobs

There is no best AI: there's the right one for the task.

TEXT AND IDEAS

ChatGPT

by OpenAI

The generalist

- Quick drafts
- Images in chat
- Lots of connected apps

TEXT AND WORK

Claude

by Anthropic

The collaborator who reasons

- Polished texts
- Works on files and tools
- Docs, Slides, Design

GOOGLE ECOSYSTEM

Gemini

by Google

The assistant in Gmail and Drive

- Already in your account
- Mail, Drive, Docs
- NotebookLM

RESEARCH

Perplexity

by Perplexity AI

Research with sources

- Trends and competitors
- Clickable sources
- Comet browser

IMAGES AND VIDEO

Leonardo AI

by Canva

The visual studio

- Moodboards and concepts
- Images and video
- Many models

OVERVIEW 1 OF 5

ChatGPT

by OpenAI

The generalist: does a bit of everything, fast

What it is

The most widespread AI assistant, by OpenAI. Current models: the GPT-6 family. Strong on speed, versatility and images generated in chat.

For marketing

- brainstorming claims and ideas
- first drafts and quick variants
- concept images on the fly
- careful: check facts and figures

OVERVIEW 2 OF 5

Claude

by Anthropic

The collaborator that reasons and works on your files

What it is

Anthropic's AI assistant. Current models: Opus 5.5 and Sonnet 5.5. Strong on reasoning, polished writing and working on documents and folders.

For marketing

- copy, press releases, on-brand sheets
- works on files and tools
- creates documents, slides and graphics
- automates repetitive work

OVERVIEW 3 OF 5

Gemini

by Google

The assistant that lives in Gmail, Drive and Docs

What it is

Google's AI assistant, already in every Gmail account. Models 3.x Flash and Pro. It lives inside Gmail, Drive, Docs, Sheets and Meet.

For marketing

- summarising long email threads
- finding files and information in Drive
- NotebookLM on brand books and catalogues
- images (Nano Banana) and video (Veo)

OVERVIEW 4 OF 5

Perplexity

by Perplexity AI

The researcher that always shows its sources

What it is

An answer engine: it searches the web and answers citing clickable sources. It also has Deep Research and the Comet AI browser.

For marketing

- industry and design trends
- competitor monitoring
- market data with sources
- preparing for trade fairs and events

OVERVIEW 5 OF 5

Leonardo AI

by Canva

The visual studio for images and video

What it is

A platform to generate images and video with many different models in one place. It's part of Canva.

For marketing

- moodboards and setting concepts
- social visuals and video teasers
- deep dive in section 11

Which AI for what

They work together: each one where it's strongest.

IF I NEED TO...	USE	WHY
Finding trends, data, competitor moves	Perplexity	Cites sources: you can check
Writing copy, press releases, product sheets	Claude	Consistent tone, polished texts
Working inside Gmail, Drive, Docs	Gemini	Already in the Google ecosystem
Quick brainstorming, an image on the fly	ChatGPT	Fast, images in chat
Moodboards, settings, social visuals	Leonardo AI	Control over visual style
Automating a repetitive job	Claude	Folders, connectors, scheduled tasks

The prompt

Section 02 · How you talk to an AI

1

Role

Who the AI should be

+

2

Context

The situation, the brand, the audience

+

3

Task

Exactly what it has to do

+

4

Format

How you want the result

Before and after

VAGUE PROMPT

“Write an Instagram post for the new kitchen.”

Result: generic, fits any brand.

COMPLETE PROMPT

“You are the social media manager of a high-end kitchen brand. Write 3 caption variants for the launch of a new model, for an audience of architects and families. Elegant tone, max 300 characters, 3 hashtags.”

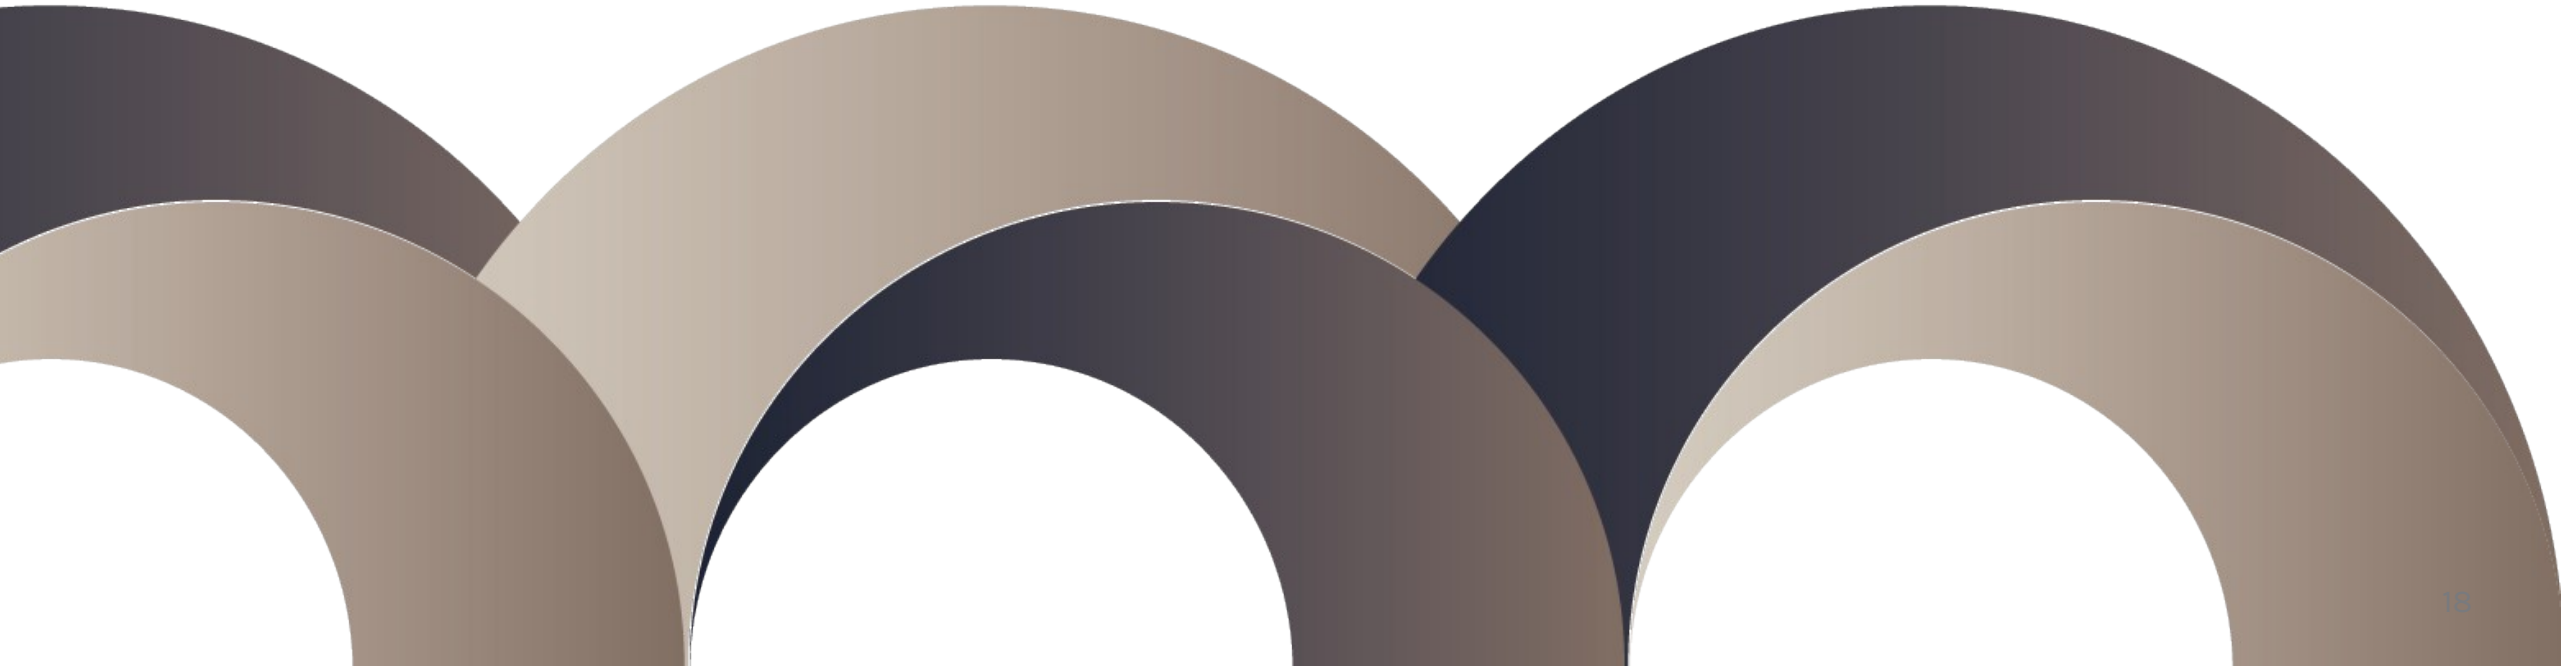

Three tricks that work

1. Give it a role: “You are our brand's copywriter”. It changes register and depth.

2. Show examples: paste 2 or 3 approved texts and ask for the same style.

3. Iterate in the same chat: “shorter”, “fewer adjectives”, “add a call to action”.

Bonus: ask the AI to ask you questions before it answers. “Before you write, ask me what you need to know.”

Pipeline: 3 trends for 2027

Suggested path: three 2027 living room trends, one post for each.

01

Perplexity

Deep Research: 3 living room trends for 2027, with sources

RESULT

Report with links

→

02

You

Check the sources and choose what to keep

RESULT

3 solid trends

→

03

Claude

In the brand project: one post idea per trend

RESULT

3 on-brand captions

→

04

Leonardo AI

A concept image for each post

RESULT

3 visuals

→

05

Claude Design

Lay out the 3 posts in social format

RESULT

Posts ready to review

Each tool does what it does best. The final review is always yours.

The pipeline prompts

1. Perplexity: “What are the 2027 living room trends? Three trends with industry sources, each with materials, colours and an example.”

2. You: open the sources, drop anything weak.

3. Claude, in the brand project: “For each of these 3 trends, suggest an Instagram post with a caption in our tone of voice.”

4. Leonardo AI: one image prompt per trend (see section 11).

5. Claude Design: “Lay out the 3 posts in 4:5 format in the brand colours.”

Three side by side

Section 03 · ChatGPT, Claude and Gemini

What they have in common

Today ChatGPT, Claude and Gemini are more alike than they seem:

- chat with web search and file uploads
- projects or spaces with instructions and documents
- memory of conversations
- connection to external apps (mail, calendar, drive)
- agents that carry out multi-step tasks
- individual plan at about 20 dollars a month

The difference is their character and how they work with you.

The comparison

	ChatGPT	Claude	Gemini
Character	Versatile and fast	Thoughtful and precise	Integrated with Google
Models today	GPT-6 Astra, Sol, Luna	Opus 5.5, Sonnet 5.5	Gemini 3.x Flash and Pro
Long texts	Good	Key strength	Good
Images	Generates them in chat	No photos: creates graphics and layouts	Generates them (Nano Banana)
Working on files	Agent and connected apps	Folders, connectors, Chrome	Gmail, Drive, Docs
Finished outputs	Canvas, files	Docs, Slides, Design	Google Docs and Sheets
Automations	Automations and agents	Scheduled tasks	Google actions and agents
Base plan	Plus, about $20	Pro, $20	AI Pro, about $20

Data as of October 2026, monthly prices excluding VAT: check before the session

ChatGPT is fast and generates images.

Claude reasons, writes with care and works inside files and tools.

Gemini is already inside Gmail and Drive.

When to use what

ChatGPT when you need speed, an image on the fly or an app from its ecosystem.

Gemini when the work is inside Gmail, Drive or Google Docs.

Claude when the text must be polished and on-brand, when you work on long documents or want the AI to act on folders and tools.

If in doubt: try the same request on two tools and compare.

The method matters more than the tool

Inside Claude

Section 04 · Surfaces, modes, workspace, models

The Claude map

Eight building blocks. Start with chat and projects, add the rest when you need it.

01

Chat

You talk and reason it through

02

Projects

The collaborator's memory

03

Artifacts

The finished document

04

Scheduled tasks

Works on its own, on a schedule

05

Personalization

Knows you and how you write

06

Connectors & MCP

The sockets to your tools

07

Claude Design

The in-house graphic designer

08

Claude Code

The tool builder

Where to use Claude

The same Claude, in several places:

- Desktop app (Mac and Windows): the full version, recommended
- Browser, on claude.ai: handy from any computer
- Mobile app: to chat, dictate and follow tasks in progress
- Claude in Chrome: an extension that browses and acts on websites
- Claude in Excel and PowerPoint: works inside Office files
- Claude for Google Workspace (beta): in Docs, Sheets and Slides

Account, projects, artifacts and scheduled tasks are the same everywhere.

	Desktop app	Browser and mobile
Conversations, projects, artifacts	Yes	Yes
Docs, Slides, Design	Yes	Yes
Folders on your computer	Yes	Only with the desktop app open
Built-in browser and computer use	Yes	Only with the desktop app open
Scheduled tasks	Yes, in the cloud too	Yes, in the cloud
Code tab	Yes	Separate web version
Shortcuts and quick dictation	Yes	Limited
From any PC, no install	No	Yes

Desktop or browser?

The desktop app is the gateway to your computer: folders, the built-in browser and computer use only work while it's open, even if you're working from the browser or your phone.

One single conversation

Since the latest update you no longer choose between Chat and Cowork: Claude works out what's needed on its own.

	Chat	Cowork	Code
What it does	Answers, reasons, writes	Executes: files, folders, connectors, browser, even in the background	Writes and runs code on a project
How you get there	You write in the conversation	Same conversation: Claude moves to the work on its own	Code tab, separate
Example	“Give me 5 headlines for the newsletter”	“Read the brief in the folder and prepare the plan”	“Rename the 500 photos from the shoot”
Permissions	None	Manual (asks) or Auto	You approve the steps

What has changed

- The choice between Chat and Cowork is gone: you just write.
- Claude answers a quick question or starts a piece of work (research, reports, sheets, presentations) in the same conversation.
- Recents brings chats and tasks together.
- No web search switch: Claude searches when needed.
- In-depth research: /deep-research or + > Research.
- Projects work in every conversation.
- The Code tab stays separate.

Where things ended up

- Cowork global instructions: now in Settings > General > Instructions for Claude.
- Authorised folders: Settings > Trusted folders.
- Folder where Cowork saved its work: Settings > Storage folder.
- Permissions: in the input box, Manual or Auto.
- Old Cowork tasks: in Recents, they reopen as before.
- Local files, built-in browser and computer use: only with the desktop app open.
- Claude always asks before permanently deleting files.

1. Sidebar: Recents, Projects, Artifacts, Scheduled
2. Conversation: requests and answers
3. Approvals: Allow or Deny
4. Input: + attach or Research, / for skills
5. Model, effort, Manual or Auto permissions
6. Progress: the steps under way
7. Context: folders, connectors, skills
8. Output: the files created, ready to open

The workspace

How Claude works

The cycle of every task, from request to delivery.

1

Understands

Reads the request and asks you questions if needed

→

2

Plans

Breaks the work into steps: you see them in Progress

→

3

Uses tools

Reads files, searches the web, uses connectors

→

4

Asks

Waits for your OK on important actions

→

5

Delivers

Saves files or artifacts and sums up what it did

You stay in control: you can stop it, correct it, ask it to redo a step.

How to set up the work

Three choices before you start:

- Permissions: Manual (default) to begin with, Claude asks before acting. Auto: it works on its own with automatic safety checks.
- Where it works: a dedicated folder, never the whole disk.
- With what: only the connectors and skills that job needs.

While it works you can stop it, correct it or tell it “redo step 3 like this”.

At the end: Claude sums up what it did and where it saved the files.

What is a model

The model is the “brain” that answers. Anthropic offers several, like engines of different power:

- Haiku: quick and light, for simple tasks
- Sonnet: balanced, the everyday model
- Opus: deep reasoning, for serious work
- Fable: for long projects carried forward on its own

The number (e.g. 5.5) is the generation: higher means more recent.

Next to the model there's the effort: how much Claude thinks before answering.

What is a token

A token is the unit an AI reads and writes in: a piece of a word, about 3 or 4 characters.

Everything is measured in tokens:

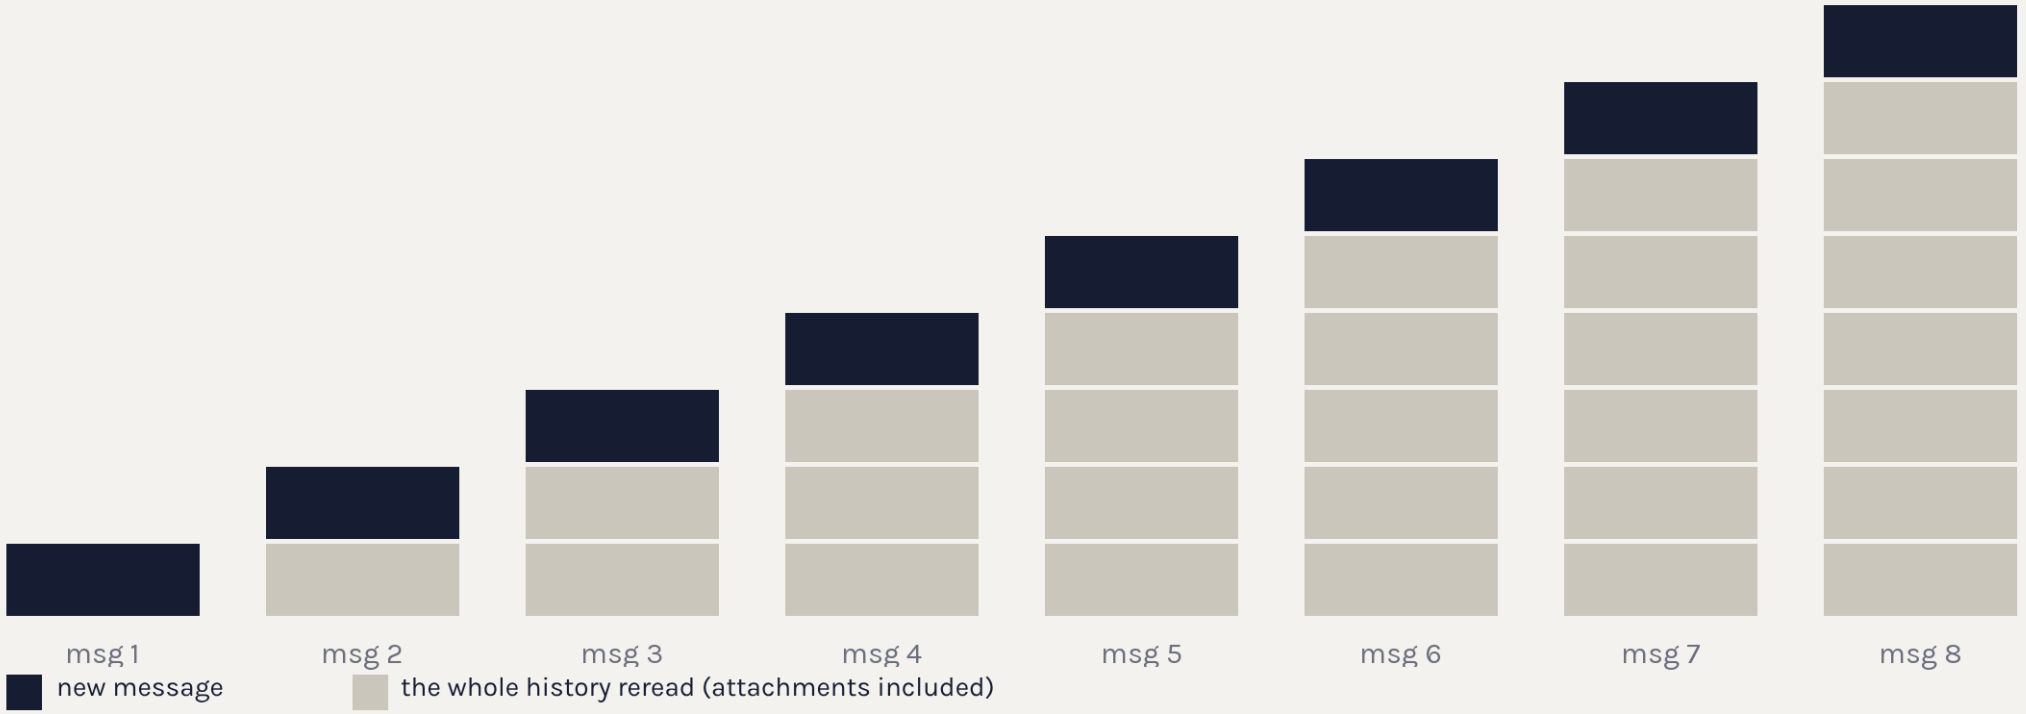

- what you write and the attachments
- the whole conversation, which Claude rereads with every message
- the internal reasoning and the answer

Your plan has a usage limit that resets every 5 hours, plus a weekly cap. The more tokens you use, the sooner you hit it.

Why long chats weigh more

Message 8 costs as much as all the previous ones put together.

WITH EVERY MESSAGE CLAUDE REREADS THE WHOLE CONVERSATION

Models and usage

The right model for the right task: not too much, not too little.

	Haiku	Sonnet	Opus	Fable
Character	Fast and light	Balanced	Deep reasoning	Long projects on its own
Usage	Low	Medium	High	Very high
Use it for	Summaries, extractions, short answers	Everyday writing and analysis	Strategy, complex documents	Big, critical jobs
Marketing	Summarise this email	Write 3 posts from the press release	Analyse the report and propose the plan	Build the entire launch kit

The more powerful the model and the higher the effort, the more tokens each answer uses

How to choose the model

Four questions, one answer.

?

Simple and quick?

Haiku

Summarise, extract, answer briefly

→

?

Everyday work?

Sonnet

Texts, analysis, plans: the default

→

?

Need to think it through?

Opus

Strategies, complex documents

→

?

Long and autonomous?

Fable

Big projects over several hours

Practical rule: start with Sonnet. Only move up a model if the answer isn't good enough.

Using it mindfully

1. Choose the model and effort that fit the task.
2. One chat per topic: when you change subject, open a new one.
3. Don't upload the same files again: use projects and folders.
4. Group your questions into a single message.
5. Ask for short answers when a short answer is enough.
6. In-depth research only when you really need it.
7. Check your usage in Settings > Usage.

Working well

Section 05 · Projects, folder, artifacts and files

The chat, used well

Before you hit enter, three choices change the answer:

- the model and the effort
- the tools: attachments and Research with +, skills with /
- the project you're in

Good habits:

- one chat per topic
- attach the material instead of summarising it in words
- ask for sources when you use web search
- rename important chats so you can find them

Projects

Memory: set it up once, it always knows you

Projects

A space with permanent instructions and materials: every conversation inside it starts already knowing who you are and how you work.

Two kinds

- on claude.ai: in the account, shareable with the team
- on desktop: with local folders, memory and scheduled tasks
- they can be linked to each other

The folder

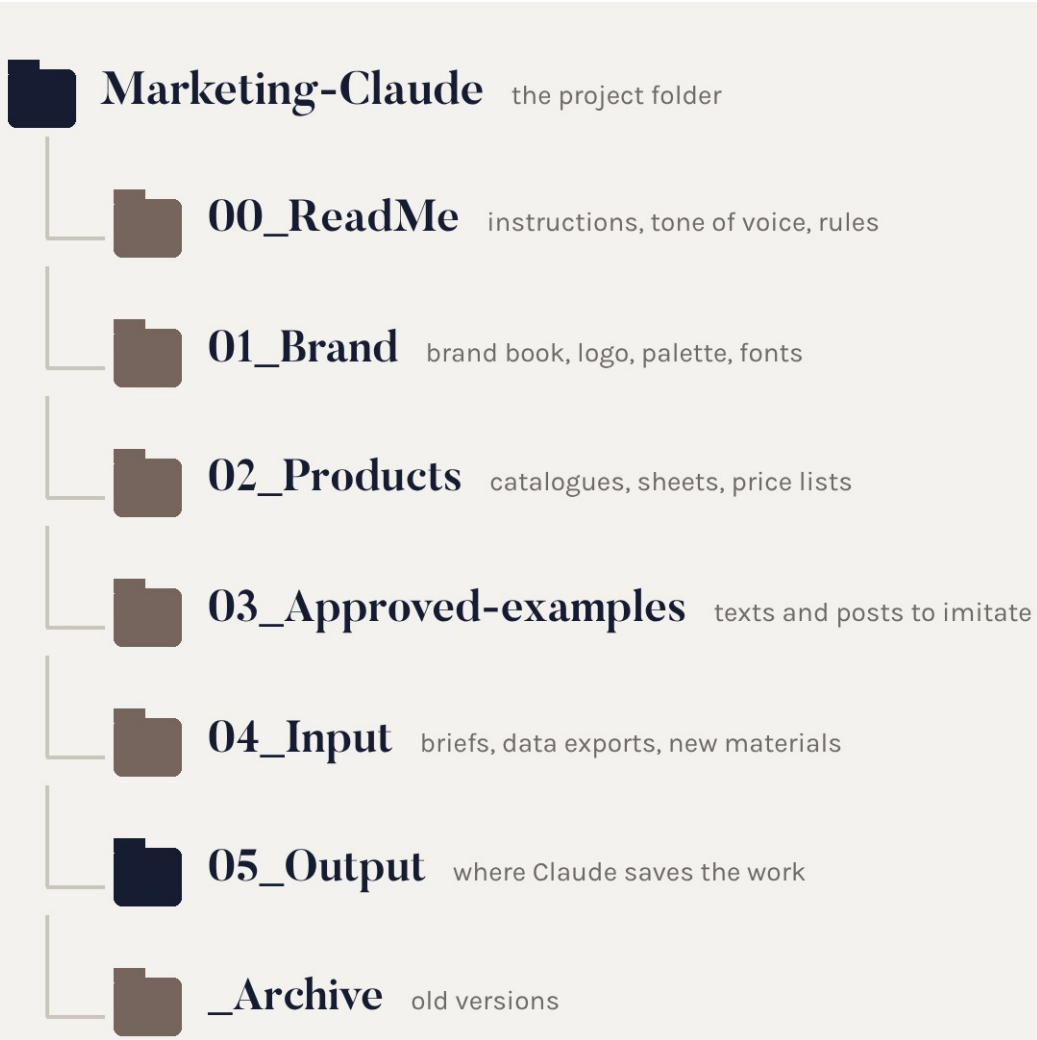

The workbench you share with Claude

Why a folder

Linking the project to a folder is the move that changes everything: Claude works on your desk, not on copies uploaded to the chat.

What you gain

- reads documents without uploading them
- always sees the latest version
- saves outputs there, no searching
- you save tokens and time

The ideal folder

A simple structure, the same for everyone. Claude knows where to find the rules, where to read the materials and where to save the work.

The ideal project, step by step

1. Create the folder with the structure we just saw.
2. Desktop app > Projects > + > Use an existing folder.
3. Give the project a name and description.
4. Write the instructions (example on the next slide).
5. Link the team's claude.ai project, if there is one.
6. Turn on only the connectors and skills you need.
7. First test: “Read 00_Read_me and tell me what you understood about the brand”.

Example instructions

“You are the brand's marketing collaborator.

Before every job, read 00_Read_me and 01_Brand.

Only use data found in the folder: if something's missing, ask, don't make it up.

Tone: elegant, warm, short sentences, no superlatives.

Always save work in 05_Output, named date_topic_v1.

Never overwrite a file: create a new version.

At the end, tell me what you did and where you saved it.”

Artifact or file?

	Artifact	File
What it is	A result that lives inside Claude	A real document: .docx, .pptx, .xlsx, .pdf
Where you find it	Artifacts section, shareable link	In the working folder on your PC
How you edit it	In the Claude editor or by asking Claude	With Office, or by asking Claude
Best for	Docs, Slides, Design, live pages, mini apps	Deliverables, attachments, archive
Switching	Exports to Word, PowerPoint, PDF	Can be published as an artifact

They're two different things. An artifact lives inside Claude and is shared with a link. A file is the real document in your folder.

Artifacts

An artifact is the finished work Claude delivers separately, clean and reusable.

- Docs: documents to write together and comment on
- Slides: presentations to present or export
- Design: graphics, mockups, pages
- Live pages and mini apps: trackers, calculators, dashboards

You find them in the Artifacts section, share them with a link and export them to Word, PowerPoint or PDF.

Careful with edits

The golden rule to avoid losing work.

OPTION A

Ask Claude

Type in the chat what to change: “in slide 4 shorten the title, in slide 7 add the price”. Claude regenerates the file with the changes, without losing anything.

OPTION B

Duplicate and rename

Want to touch it up by hand? First duplicate the file and rename it (e.g. report_v2_Mario.docx). Work on the copy: Claude will not touch it.

Why? When Claude edits a file it rewrites it from scratch: changes made by hand on the original are lost.

Claude Design

The in-house designer: from brief to layout in minutes

Claude Design

Launched in April as a separate app, since September it's inside Claude. From a brief it produces an editable layout, even with the brand's design system.

For marketing

- landing page and newsletter mockups
- social posts and event posters
- on-brand presentations
- for photos, there's still Leonardo AI

Skills and agents

Section 06 · Agents, connectors, scheduled tasks, Code

Skills

The manual Claude takes off the shelf when it needs it

What it is

A folder with an instruction file (SKILL.md) that teaches Claude how to do a task well: a method, a tone, a format.

How it works

- switches on by itself when needed
- or you call it up with /
- works in every project
- e.g. “tone of voice”, “press release”

Inside a skill

```
---
name: brand-tone-of-voice
description: Use this skill when you write
  copy, posts, press releases or newsletters
  for the brand. Applies tone and rules.
---

# Tone of voice
Elegant, warm, never shouted.
Short sentences. No empty superlatives.

## Words yes / words no
Yes: material, light, project, made to measure
No: incredible, top, unmissable

## Approved examples
See examples/approved_posts.md
```

when it kicks in

the method

attached materials

No code required: it's text. The description at the top decides when the skill kicks in, the body explains the method.

Directory

Skills, connectors and plugins ready to install

The marketplace

Claude Marketplace (since September): plugins, connectors, agents and partners in one place. Open it from Customize > Skills, Connectors or Plugins > +.

What you'll find

- skills for Word, Excel, PowerPoint, PDF
- plugins: bundles of skills and connectors
- e.g. the Marketing and Brand Voice plugins
- skills shared by the team

Creating a custom skill

1. Pick a task you repeat often and always do the same way.

2. Ask Claude: “Create a skill that…” and describe the task.

3. Claude asks you questions, then writes the skill.

4. Attach good and bad examples: they make it precise.

5. Save it from the review card, or upload the file in Customize > Skills.

6. Try it on 3 real cases and ask Claude to fix it.

7. Share it with the team.

Skill ideas for marketing

- Tone of voice: rewrites any text in the brand's style
- Press release: structure, length, boilerplate
- Product sheet: from technical data to emotional copy
- Social posts: formats, lengths and hashtags per channel
- Campaign report: from the exports to the document for management
- Presentation in the group template
- Briefs for agencies and photographers

Agents

The collaborator with its own desk, who takes on a whole task

What it is

A collaborator with a separate context: Claude hands it a whole task, it carries it out on its own and reports back only the result.

When you need it

- long, multi-step jobs
- several analyses in parallel
- broad research to summarise
- keeping the conversation clean

How to create an agent

An agent is a role file with four elements:

- name and description: who it is and when to use it
- tools: what it can use (files, web, connectors)
- model: which brain it works with
- instructions: its working method

You create one by asking Claude, inside a plugin or in Claude Code.

A simple way to start: a project with role instructions is already a “lightweight agent”.

Skill or agent?

	Skill	Agent
Metaphor	The manual on the shelf	The colleague with their own desk
What it brings	Knowledge, method, format	A role you hand a whole task to
Where it works	Inside the conversation	In a separate context, then reports back
It kicks in	On its own, when the request matches	When Claude delegates the work to it
How to create it	“Create a skill that…”	Role file, inside a plugin or in Code
To get started	Yes: the most useful investment	Later, for big or parallel jobs

It's not a choice: they work together. Skills provide the method, agents do the work.

How they work together

An example: analysing a trade fair with three agents and their skills.

Agents work in parallel, each at its own desk. Skills give each one the method.

Connectors

The sockets that connect Claude to your tools

What it is

Connectors link Claude to mail, calendar, Drive, SharePoint, Canva, CRM. MCP is the standard that makes them work: like a USB-C socket.

How to use them

- Customize > Connectors
- Claude only sees what you authorise
- Claude in Chrome browses websites

Scheduled

The collaborator that works even when you're away

What it is

Describe a job once and Claude repeats it on its own: every hour, every day, every week or on demand. It runs in the cloud, even with your PC off.

How to create one

- Scheduled > Create with Claude
- describe the job in words
- uses connectors and skills already on
- basis of automations (section 08)

Claude Code

The builder: creates small custom tools

What it is

The mode where Claude writes and runs code. You'll find it in the Code tab of the desktop app, in the terminal and on the web.

For non-programmers

- rename 500 photos in one go
- a mini site for an event
- turn a price list into product sheets
- edit and cut a video
- small custom tools

Claude Code in practice

When to use it instead of the chat:

- the work touches dozens or hundreds of files
- you need a tool to reuse, not an answer
- you want a “technical” result: web page, script, data file

How to work:

- open the Code tab and choose the folder
- describe the result, not the code
- approve the steps and test the result on a few files

Security: Manual or Auto

When Claude acts on mail, files and tools, you decide how much autonomy to give it.

- Manual (default): Claude asks before acting. It's the starting point.
- Auto: works without asking at every step. Only for drafts and research, when the workflow is proven.
- Irreversible actions (sending, paying, deleting, publishing) always need approval.
- Connect only the folders and accounts you need.
- Review active connectors and skills from time to time.

Pipeline: a launch

Suggested path: from a new product to all the content.

01

Claude

Brand project with tone of voice and product sheet

RESULT

Context ready

→

02

Claude

Press release for the new product

RESULT

Draft in a Doc

→

03

You

Review and approval of the text

RESULT

Release approved

→

04

Claude

Three social posts and the newsletter from the release

RESULT

Consistent content

→

05

Claude Design

Poster for the showroom event

RESULT

Visual ready

One context, many formats: everything starts from the brand project.

The pipeline prompts

1. Brand project with tone of voice and the new product sheet in the folder.

2. “Write a press release for [new product], max 2,500 characters, with a quote from the marketing director. Create a Doc.”

3. You review and approve.

4. “From the approved release, derive 3 posts for Instagram and LinkedIn and a newsletter.”

5. “With Claude Design, create a poster for the showroom event, A3 format, brand colours.”

The ideal setup

Section 07 · Ten moves to start well

Ten moves for the setup

1. Install the desktop app and sign in with your company account.
2. Settings > General: write your Instructions for Claude.
3. Set Sonnet with medium effort as the default.
4. Authorise the work folder (Trusted folders).
5. Create the work folder and the linked project.
6. Upload brand book, tone of voice, approved examples.
7. Install the skills for Word, Excel, PowerPoint and the Marketing plugin.
8. Connect only the useful connectors, with IT.
9. Permissions: Manual.
10. Check memory and usage once a month.

Personal instructions

Example to adapt, in Settings > General > Instructions for Claude:

“I work in marketing at the Colombini Group, premium furniture sector.

When data is missing, ask me for it, don't make it up.

For long texts, propose an outline first.

Always cite your sources when you search the web.

If a task is ambiguous, ask me a question before you start.”

Memory and privacy

Memory: Claude remembers facts and preferences from one conversation to the next.

- you can see, correct and delete it in the settings
- in projects it's separate: each project has its own

Privacy:

- use your company account, not your personal one
- don't upload sensitive customer data unless you need to

Mistakes to avoid

- Endless chats on different topics: they waste tokens and cause confusion.
- Uploading the same files every time instead of using the folder.
- Using the most powerful model for everything.
- Touching up a file by hand and then asking Claude to regenerate it.
- Giving access to the whole disk or every account.
- Trusting numbers and facts without checking them.
- Starting with the most complex automation.

Automations

Section 08 · The method to do it yourself

The work nobody loves

Every marketing department has jobs that repeat the same way:

- agency and supplier invoices to forward to whoever approves them
- material requests from retailers
- weekly social and campaign reports
- press reviews and competitor monitoring
- photos from shoots to rename and file

They follow rules you could explain to a new colleague. If you can explain them, Claude can carry them out.

The 5-move pattern

Every automation, simple or complex, is built like this.

1

Trigger

When does it start?

Every hour, every Monday, or when an email arrives

→

2

Read

What does it look at?

Inbox, folder, file, website

→

3

Decide

With which rules?

A table written by you: if… then…

→

4

Act

What does it do?

Forwards, saves, renames, writes a draft

→

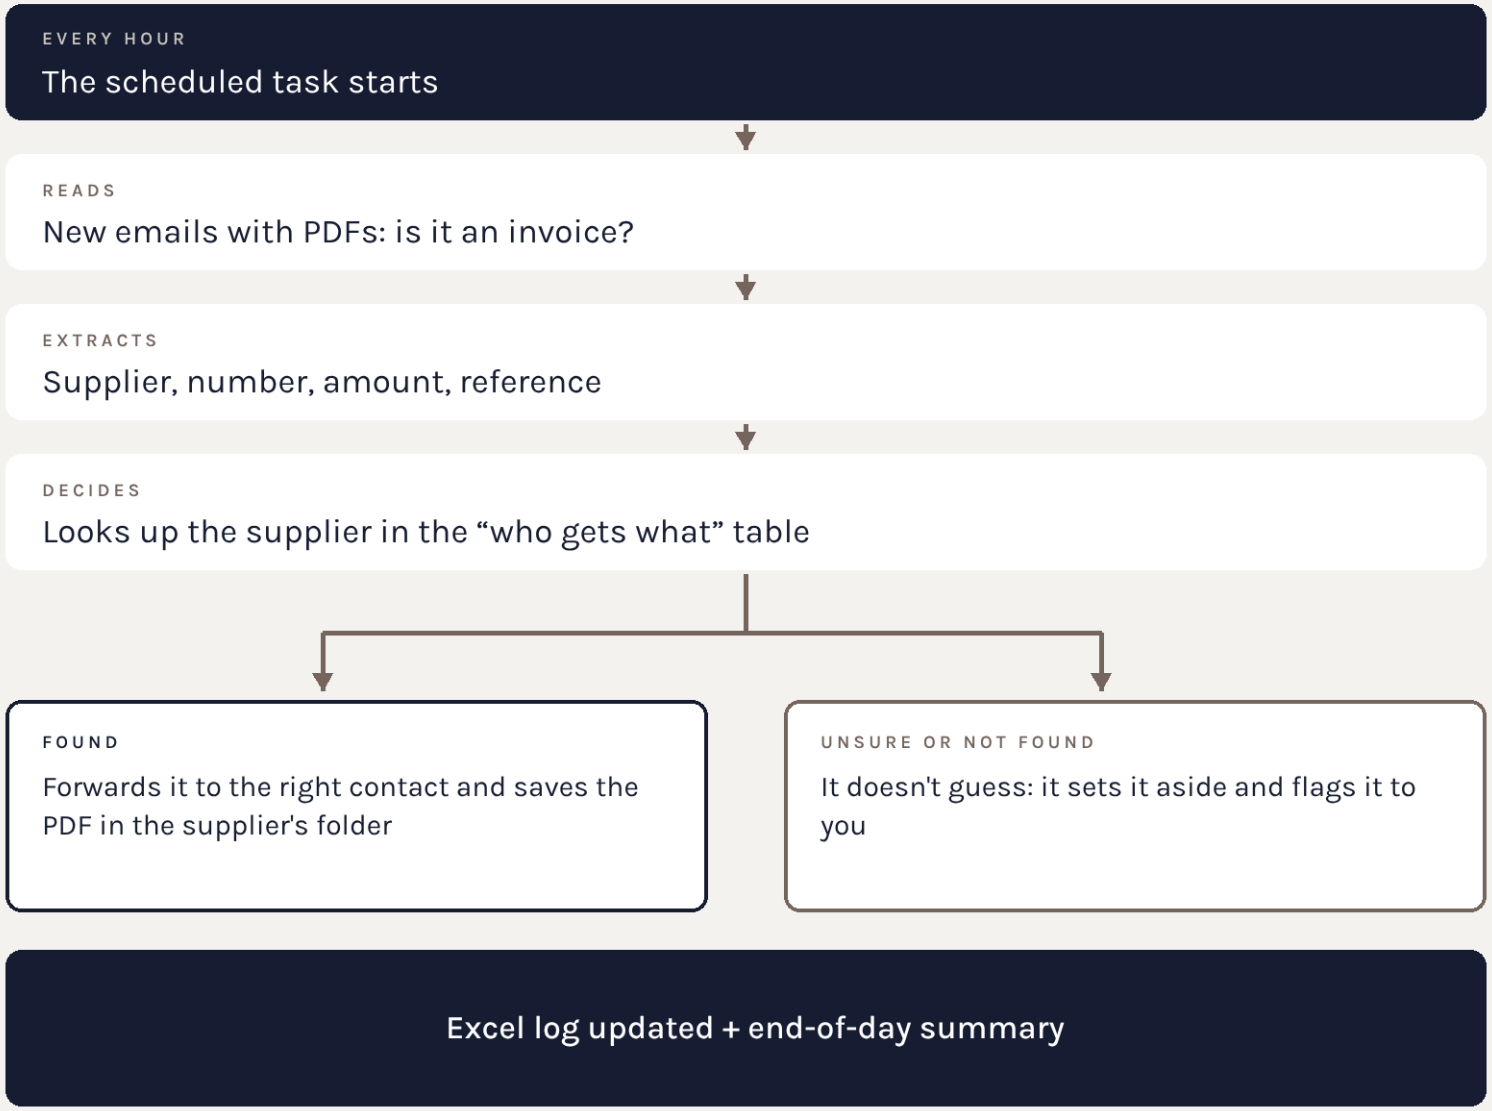

5

Log

How do you know?

Updates a file and sends you the summary

And you? You approve the exceptions and check the log. You decide the rules.

Example: the invoice

An invoice arrives by email. Claude recognises it, reads the supplier, looks up in the table who should receive it and forwards it.

If it's unsure, it doesn't guess: it flags it to you.

The rules in a table

The secret is to separate the rules from the instructions. Create a “who gets what” Excel file:

- Social Agency → Maria → Invoices/Social
- Photo Studio → Luca → Invoices/Shoots
- Trade Fair → Anna → Invoices/Events

When a contact person changes, you update the table: the automation stays untouched.

Put it in the project folder.

The task prompt

“Every hour, check the marketing inbox. For every new email with a PDF that looks like an invoice:

1. read supplier, number, date, amount

2. look up the supplier in who_gets_what.xlsx

3. if you find it, forward it to the contact person and save the PDF in their folder

4. if you can't find it or you're unsure, do nothing and add it to the list to check

5. update invoice_log.xlsx

At 6 p.m., send me a summary.”

Examples

Four repetitive marketing jobs, one pattern

Retailer requests

Trigger: new email. Read: what's being asked. Decide: catalogue, photo or price list? Act: draft reply with the right link. Log: list of requests.

Weekly social report

Trigger: Monday at 8. Read: exports in the folder. Decide: what went up or down. Act: Doc with charts and commentary. Log: archive.

More examples

Same pattern, different problems

Press review and competitors

Trigger: every Friday. Read: industry sites and competitor pages. Decide: what's relevant. Act: summary with sources. Log: review archive.

Shoot photo archive

Trigger: at the end of a shoot. Read: the photo folder. Decide: product, finish, setting. Act: rename and sort. Log: list of files.

The golden rules

1. Start with a small, frequent job.

2. Write the rules the way you'd explain them to a new colleague.

3. Begin with permissions on Manual: watch for one or two weeks.

4. Always plan for the “I don't know” case: better a flag than a mistake.

5. Keep a log of everything it does.

6. Never automatic sending, payments or deletions at the start.

Pipeline: your automation

Suggested path to build your first automation on your own.

01

You

Pick a small, frequent job

RESULT

The candidate

→

02

You

Fill in the 5 moves and the rules table

RESULT

The design

→

03

Claude

Scheduled > Create with Claude: paste in the design

RESULT

The task

→

04

Claude

Run it with Manual permissions for 2 weeks

RESULT

The real cases

→

05

You

Fix the rules, then grant more autonomy

RESULT

The automation

Start small, observe, expand. Never the other way round.

The template to fill in

Copy and complete it, then paste it into Scheduled > Create with Claude:

1. Trigger: when does it start? (every hour, every Monday, on demand)

2. Read: what does it look at? (inbox, folder, file, website)

3. Decide: which rules? (attach the table)

4. Act: what does it do? (draft or direct action)

5. Log: where does it record things and when does it tell you?

Doubtful case: “if you're not sure, do nothing and flag it to me”.

Trust

Section 09 · Checking and the first step

Always check

AI images and texts:

- check rights, trademarks and consistency with the guidelines
- real products must not be “invented” by AI
- numbers and data must always be double-checked

Checking in 4 moves:

1. ask for sources
2. compare with data you know
3. use your expert judgment
4. test small before you publish

What to take home

01 Every AI has its job: Perplexity searches, Claude writes and works, Gemini lives in Google, ChatGPT is fast, Leonardo creates images.

02 The prompt is everything: role, context, task, format.

03 Right model, short chats, connected folder: fewer tokens, better quality.

04 Claude rewrites files: ask Claude or work on a copy.

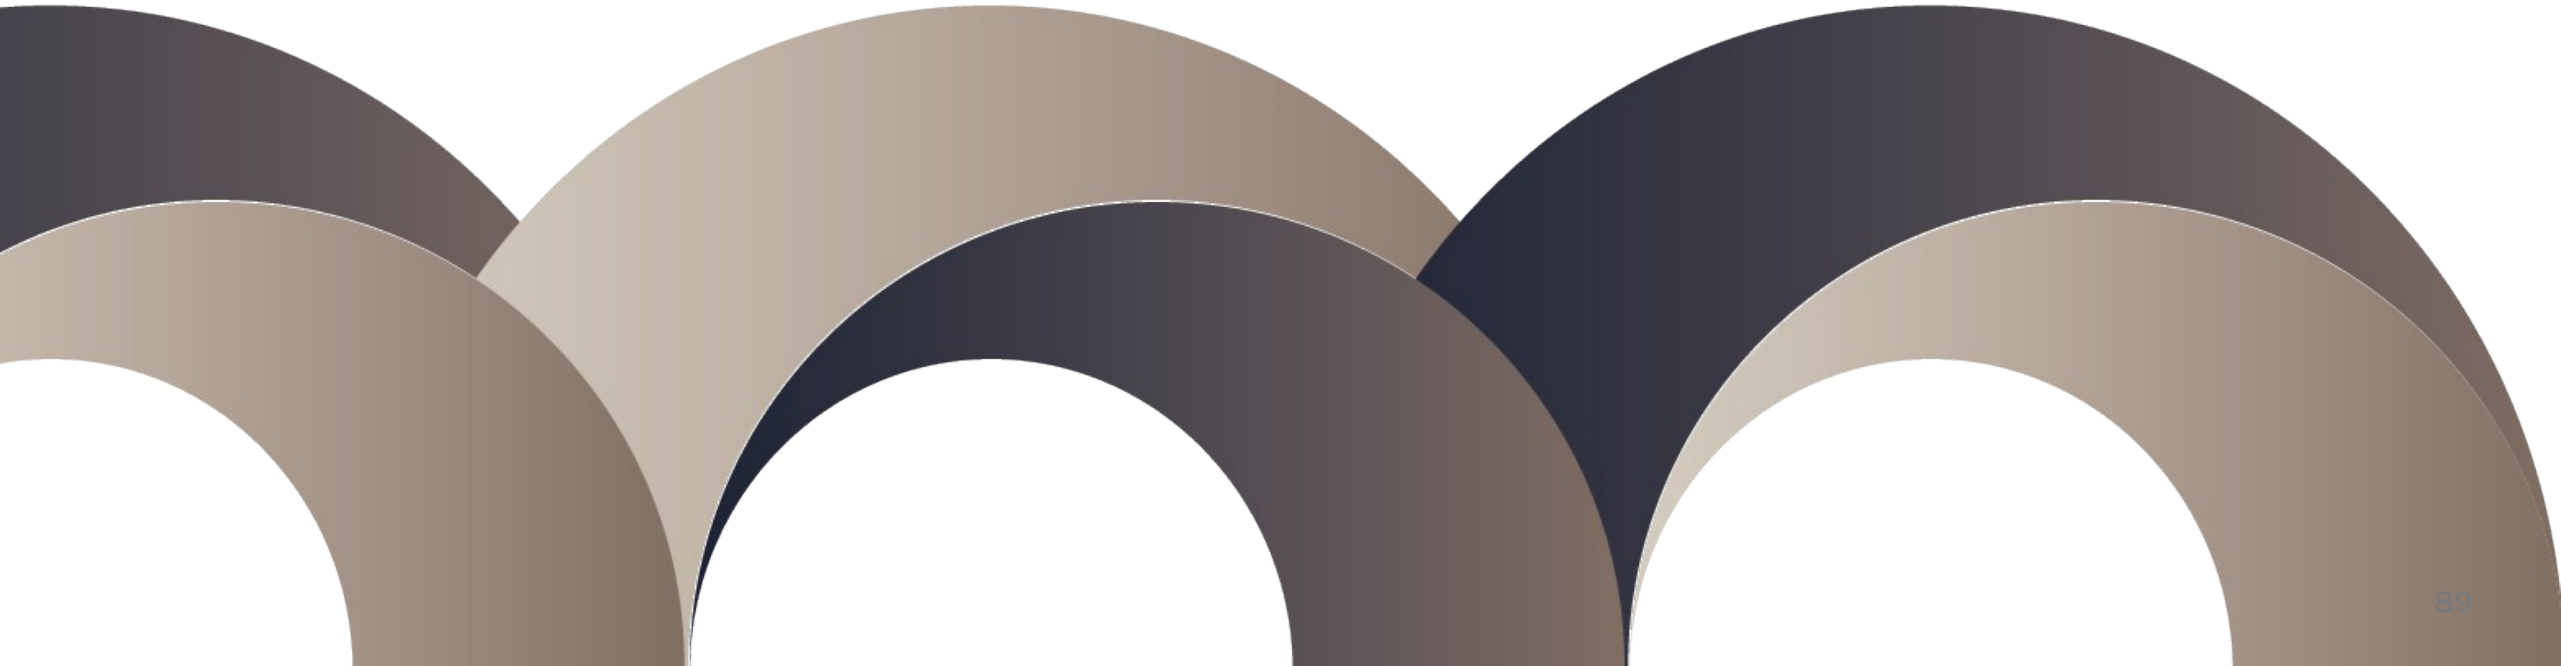

05 Every automation is made of 5 moves. Ask first, then delegate.

The first step, by tomorrow

Just one action, small and concrete:

- create your work folder and the linked project
- put tone of voice and two approved texts in 00_Read_me
- ask for a variant of a real piece of content
- judge the result: what's missing? Add it to the instructions

At our next meeting we'll start from your projects and your automations.

Events office

Section 10 · A digital team for events

The idea: an office of agents

Picture the events office as a digital team:

- each agent has a role: research, communication, logistics, reporting
- each has its own hours: some work every morning, some every Monday, some once the event is over
- they all work in the same folder and leave a trace of what they do
- you are the director: you assign, approve, correct

Claude is the engine: project, skills, agents and scheduled tasks.

An events office in Claude

Project, folder, skills, agents, connectors and scheduled tasks: the building blocks we already know.

The events folder

One folder for the office, one subfolder for each event. Claude finds rules, suppliers and templates, and saves everything in the right place.

Skills and agents

The office's method, split between manuals and collaborators

Skills to create

- Event brief: goals, audience, budget, KPIs
- Run of show: minute-by-minute schedule
- Invitations and communication in the brand's tone
- Post-event report

Agents

- Venue and supplier research
- Communication and guests
- Logistics and deadlines
- Analysis and reporting

Pipeline: an event

Suggested path, from brief to final report.

06

Claude

Report, thank-yous, press review

RESULT

Wrap-up

Claude prepares, you decide: everything sent to guests and suppliers goes through your approval.

Scheduled tasks

The heart of an events office that runs on its own:

- Every Monday at 9: status of all events and the week's deadlines.
- Every day: reads replies to invitations and updates the guest list.
- 14, 7 and 1 day before the event: reminders to suppliers, as drafts.
- The day after: draft thank-you to guests and photo collection.
- A week later: report with attendance, costs and results.

The kick-off prompt

To paste into the Events Office project:

“You are the assistant of the marketing events office. Read 00_Read_me and Suppliers-Venues.xlsx.

For a new event, create the folder Events/YYYY-MM_name with brief, budget and timeline.

Keep the guest list updated from emails and forms.

Prepare invitations, communications and reminders only as drafts: nothing gets sent without my OK.

Every Monday, send me the status of the events.”

Setup in eight steps

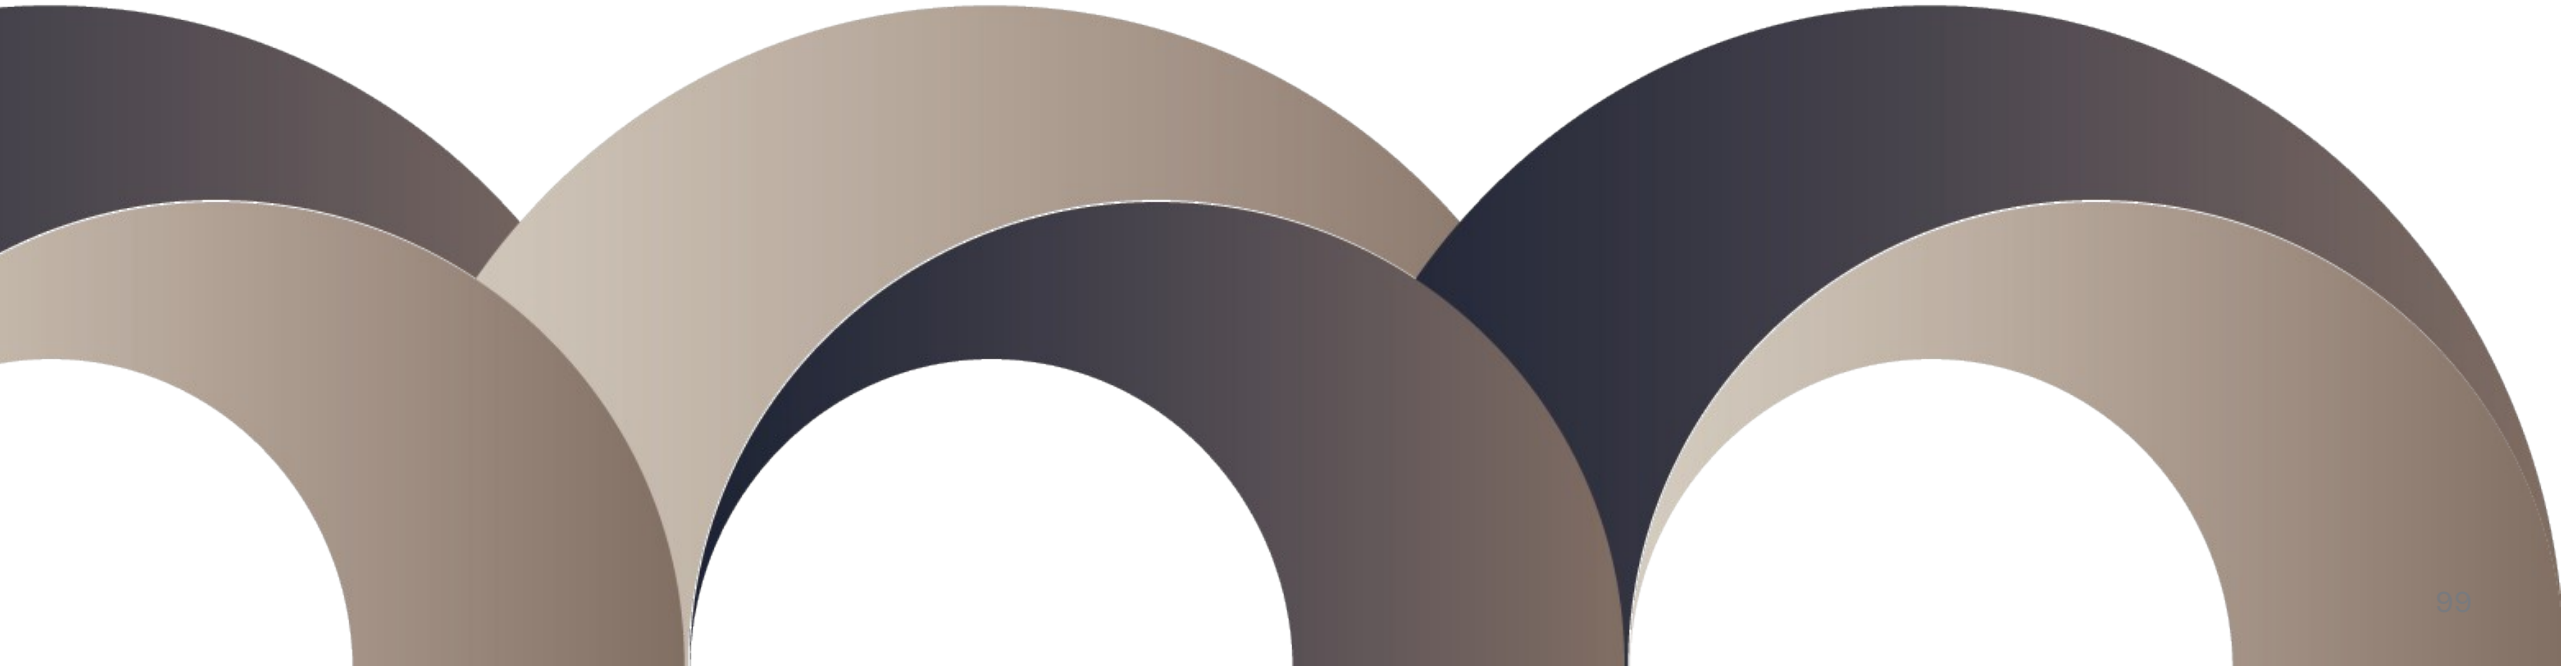

1. Create the Events-Office folder with the structure shown.
2. Fill in Suppliers-Venues.xlsx and the templates.
3. Create the project and link the folder.
4. Write the instructions (the kick-off prompt).
5. Create the skills: brief, run of show, invitations, report.
6. Connect mail, calendar and Drive or SharePoint, with IT.
7. Create the scheduled tasks, on Manual.
8. Test on a small event, then scale up.

What's left out

Claude organises, writes, checks and remembers. For some things you need dedicated tools:

- online registration and ticketing
- QR code check-in at the entrance
- payments
- attendee apps

If the platform has a connector, Claude can read its data.

A well set-up office

Leonardo AI

Section 11 · The visual studio, in detail

LEONARDO AI

How it works

From text to image, from image to video

How it works

Describe an image in words, choose a model and a format: Leonardo generates a few variants. Then you retouch, upscale or animate them.

What to know

- it's an aggregator: many different models
- every generation costs tokens
- private images on paid plans

The workspace

Six tools, from first concept to video.

1

Image

Prompt, model, format, number of images, references

→

2

Flow State

Dozens of variants to explore a direction

→

3

Editor

Edits in words, crops, expansions

→

4

Upscaler

More resolution and detail for final use

→

5

Video

Animates an image with the chosen video model

→

6

Blueprints

Ready-made flows, e.g. a 360° product video

Image models

Model	Best for
Lucid Origin	The all-rounder: concepts, social visuals, good aesthetics
Lucid Realism	Photorealism: settings, still life, portraits
Nano Banana, Pro, 2	Editing an image with words, infographics
Seedream 4.0	Native 4K: ads and print
Ideogram 3.0	Readable text in the image: posters
GPT Image 1.5	Precise editing, mockups
Flux 2 Pro / Kontext	Realism and faithful colours / editing from instructions
Phoenix 1.0	Illustrations and vector-style graphics

Model list from Leonardo.ai, October 2026

There's no single best model: each has its speciality. Leonardo can also choose on its own based on the prompt.

Video models

Model	Best for
Veo 3.1	Ads with a consistent product throughout the shot
Kling 3.0 / Turbo	Cinematic camera moves, up to 15 s
Kling Omni	Editing existing videos while keeping the subjects
Seedance 2.x	Camera control, several consistent scenes, up to 4K
MiniMax H3	Video with native audio: voice, ambience, music
LTX-2	Native 4K, opening shots
Motion 2.0	Quick social teasers from a still image

Videos use far more tokens than images

Video almost always starts from an image: it becomes the first frame, and the prompt describes the movement.

How to choose the model

- Concepts and moodboards: Lucid Origin, then Flow State for variants
- Photorealistic setting: Lucid Realism or Flux 2 Pro
- Fixing a detail: Nano Banana, with words, no masks
- Poster with text: Ideogram 3.0
- Print and ad visuals: Seedream 4.0 in 4K
- Social teaser: Motion 2.0
- Ad video with the product: Veo 3.1 or Kling 3.0

Anatomy of a prompt

Six blocks. Models perform best in English.

Subject	a modern living room with a low sofa in bouclé fabric,
Setting	large window overlooking a lake, oak floor,
Light	soft morning light, warm tones,
Framing	wide angle, eye level, 35mm,
Style	editorial interior photography, minimal, photorealistic
Format	16:9

References and touch-ups

Text alone isn't enough for consistency. Leonardo accepts reference images:

- style: “make it like this photo”
- content: a starting shape and composition
- character: the same subject across several images

Then the touch-ups:

- edits in words with Nano Banana
- upscale for the final resolution
- format expansion, from square to landscape

Tokens and plans

Every generation costs tokens: it depends on model, resolution and number of images. Videos cost much more.

- Free: 150 tokens a day
- Essential: about $12 a month
- Premium: about $30 a month
- Ultimate: about $60 a month

Tips: generate 1 or 2 images at a time, explore at low resolution, only upscale the best ones, only animate the images you've chosen.

Pipeline: from idea to video

Suggested path for a social teaser or a video for the stand.

01

Claude

From brief to concept and scene prompts

RESULT

Prompts ready

→

02

Leonardo AI

Images with the right model, a few at a time

RESULT

First versions

05

Claude

Editing, music and brand checks with HyperFrames

RESULT

Finished video

The right images first, then the movement: video costs many more tokens.

Things to watch

- Real products don't come out accurately: use them as a reference or do compositing.
- Text in images is often wrong: add it afterwards, or put it in with Claude Design (as vector or in InDesign) or with ChatGPT.
- Commercial use and private images: check the plan's terms.
- Brand consistency: palette, light and materials need guiding.
- Transparency: declare AI-generated content when required.

Thank you for your attention
